About me

I enjoy working on compilers, building tools, parallel and concurrent applications, distributed systems, among other things.

I am obsessed with correctness, maintainability and reusability in software.

I periodically write about programming languages and functional programming on my blog <https://monadplus.pro/>.

Education

2020-2022	Master's Degree (GPA: 4.5) Majoring in Computer Science. My master's thesis was <i>Distributed Complex Event Processing</i> .	Universitat Politècnica de Catalunya
2013-2017	Bachelor's Degree (GPA: 4.0) Majoring in Computer Science	Universitat Politècnica de Catalunya

Employment

2019-now	Backend Developer Part of the team that created the main product of the company, a cross-chain DLT. I mainly worked on the creation of the Coinweb node written in Haskell, and later, rewritten in Rust.	Coinweb
2017-2019	Full-stack Developer Worked as a consultant in several companies such as Mango and Stuart. I started working as a frontend developer working on Typescript, React.js, React Native and slowly transitioned to writing backends in Scala. I worked on interesting projects such as Coeli, a knowledge management system and catalogue for a museum, a real-time routing algorithm for Stuart, among others.	Agilogy
2016-2017	Mobile App Developer I developed a sophisticated remote controller as an Android and iOS app for an industrial cold room. We wrote the native app using Java and Swift, respectively. This project was part of my bachelor's degree thesis.	Blitworks

Projects

I often work on OSS on my spare time and authored several open-source projects including:

- **CPP-lang**: an educational C-alike programming language that compiles to Jasmin (JVM assembler) written in Haskell.
- **rbst**: an efficient implementation of Randomized Binary Search Trees library written in Haskell.
- **DCORE**: an efficient Distributed COmplex Event Engine.
- **floorplanning**: an implementation of *Floorplan Design of VLSI Circuits* in Haskell.
- **bwp**: the Box Wrapping Problem (BWP) solved using constraint programming, linear programming, and SAT.
- **otter-chaos-server**: a back-end server for the twitch game *Otter Chaos Repair* written in Haskell and deployed in NixOS.

Publications

2022	Distributed Complex Event Recognition
2017	Remote App Controller for an Industrial Cold Room

Talks

2019	Parallelism and Concurrency in Haskell
2018	Lenses in Scala
2018	Generic Programming in Scala
